

STYLIZED TOON SHADER

To create a new toon shader material, simply create a new material within your Unity Project, and then assign the "ToonShader" shader to the material. After that, assign the material to your mesh in your scene.

Once you've assigned the material to your 3D mesh, you'll need to decide whether you want to apply a custom texture or simply use a solid color. Use the option 'Use texture' to instruct the shader to read the texture that you can connect in the next section.

Adjust the remaining parameters such as brightness, rim light, or specular. Assign them a color and simply have fun creating visually appealing effects with this shader!
